60-MINUTE WORKSHOP

One hour from orientation to a live URL

The video supplies the shared context. Most of the hour stays with the teams.

00–14

Orient

Welcome, setup check, and the 11:47 workshop video.

2 min welcome + 12 min video

14–19

Choose the goal

Run `/wish` and agree on visible evidence.

5 min goal

19–44

Build

Use the 25-minute timer with `/one-shot`.

25 min build

44–50

Test

Complete the happy path in a real browser.

6 min test

50–58

Ship

Run `/ship-web` for GitHub and Vercel.

8 min ship

58–60

Hand off

Open the URL and name the next improvement.

2 min close

AGENT ANATOMY

The harness turns a model into an agent

The model reasons. The harness controls instructions, tools, memory, permissions, and the work loop.

01

Conversation harness

Answers and works with connected information.

02

Coding harness

Reads files, runs tools, tests, and proposes changes.

03

Operations harness

Coordinates systems, approvals, and recurring work.

Same model Different harnesses create different agents. Claude Code is a coding harness around Claude models.

Anthropic: model, harness, tools, and environment

FeedMe

WHERE AGENTS ARE HEADING

Agents can keep working after the prompt

They operate tools, preserve context, and return to people for decisions.

CURRENT EXAMPLE · OPENAI ARTWORK

Dots

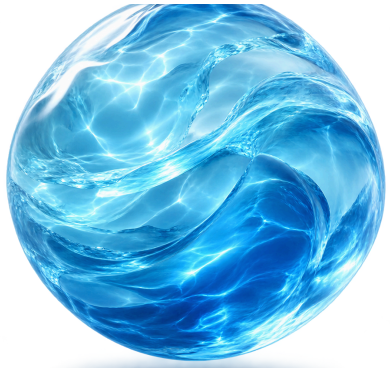

Always-on agents with their own cloud computer, connected apps, and human approvals.

CURRENT EXAMPLE · XAI ARTWORK

Grok Bot

Persistent cloud agents that coordinate across tools and bring people in for consequential actions.

FEEDME CONCEPT

Remy AI

A restaurant-operations superagent that coordinates specialist work and escalates important decisions.

OpenAI source xAI source Checked 10 November 2026

THE DELIVERY LOOP

The four-step delivery process

01

Describe

One user, one problem, one action.

02

Build

Claude creates a Next.js happy path.

03

Publish

GitHub keeps the team's source code.

04

Deploy

Vercel turns each push into a live build.

Web only Responsive Next.js websites are allowed. Native mobile frameworks are not.

PREFLIGHT

Required setup before the workshop

Finish installation and sign-in at least 48 hours before the session.

Claude Desktop

Claude Code opens

GitHub

`gh auth status`

Vercel

CLI + MCP connected

Starter

`npm run verify`

Team access

Accounts confirmed

Starter check `npm install` `npm run verify` `npm run dev`

PARTICIPANT STARTER PACK

One repository is the front door

The team repository contains the app, workshop skills, and checks.

01 **Open** the public workshop starter on GitHub.

02 **Clone** the starter to the participant's laptop.

03 **Open** the cloned folder in Claude Desktop.

04 **Run** `/workshop-onboarding`.

```
git clone https://github.com/Tanwyhang/ai-coding-workshop-starter.git
```

```
cd ai-coding-workshop-starter
```

Start here GitHub repository Complete onboarding at least 48 hours before the workshop.

FeedMe
Smart POS System

TOOL CHEAT SHEET

Four project skills guide the workflow

Type / in Claude Desktop to find the skills bundled with the repository.

01

`/workshop-onboarding`

Check Claude, GitHub, Vercel, and the starter.

02

`/wish`

Work backwards from the goal to the first testable step.

03

`/one-shot`

Turn an approved goal into one working browser journey.

04

`/ship-web`

Verify, push to GitHub, and connect Vercel Git.

Under the hood `npm` `git` `gh` `vercel`

Vercel MCP reads deployment status and logs.

CHAT DELEGATION

Parallel chats shorten the build loop

Give independent jobs to separate chats and review their results from one coordinator chat.

01

COORDINATOR CHAT

Own the goal and the code

Keeps the approved plan, makes file changes, and decides what enters the app.

02

Review chat

Walk the happy path. Report bugs without editing files.

03

Research chat

Find examples and sources. Return a concise summary.

04

Copy chat

Draft labels and messages. Return text for approval.

Safe rule One chat writes code. The other chats review, research, or draft.

Claude supports several running tasks

Parallel work consumes usage faster.

FeedMe

GOAL SEEKING

Work backwards from the goal

Start with the finished outcome. Keep asking what must be true immediately before it.

01	**Goal**	What result do we want?
02	**Evidence**	What will prove the result happened?
03	**Conditions**	What must already be true?
04	**First step**	What can the team build or test now?

Example Goal: fewer missed orders. Evidence: staff see a confirmed order. Work backwards to the customer selecting, reviewing, and submitting an item.

FeedMe
Smart POS System

DESCRIBE

Give Claude a complete coding prompt

G **Goal** — The visible change you want.

C **Context** — Who needs it and where it appears.

R **Rules** — What Claude must keep or avoid.

D **Done when** — What the tester can prove.

Example Add an order confirmation screen for counter staff. Keep the current navigation and sample data. Done when the tester sees the order number and pickup time.

FeedMe
Smart POS System

02

BUILD

Approved goal, automatic build, local check

```
/one-shot
```

Goal	Builds the approved journey in PROJECT-GOAL.md
Build	Next.js and local sample data, automatically
Verify	Fixes and re-checks until it works locally

Your tester completes the happy path in a browser.

03

PUBLISH

GitHub repository setup

```
gh auth status  /ship-web
```

Review	Check exactly what will be published
Approve	Create the repository and push
Confirm	Remote points to the team's repo

Keep the repository private unless the team chooses public.

04

DEPLOY

Vercel Git deployment setup

```
vercel link  vercel git connect
```

Link	Connect the local project to Vercel
Deploy	Let the GitHub push trigger the build
Inspect	Use Vercel MCP for status and logs

Every later GitHub push creates another deployment.

WORKSHOP START

Start with the goal

Open **START-HERE.md**, then follow the team path: `/wish` → `/one-shot` → browser test → `/ship-web`.
